The Brushing Machine is a simple and effective machine for brushing or polishing your products. The machine can be used on products such as onions and potatoes. The machine brushes the products prior to packing, or removes attached dirt and lose skins during the cleanup cycle.

A variable speed controller can be attached to the machine. The machine also contains a length adjustable skirt. Both the speed of the rollers and the length of the skirt influence the intensity of the brushing process.

The Brushing Machine can be supported on rails and fitted along with a bypass Conveyor. This allows the Brushing Machine to be disengaged from the production line and bypassed when necessary.
Eqraft designs, builds, and maintains grading, weighing and packaging solutions for agri and bulk products around the globe.
